

bucket $\rightarrow$ jab jai grouping karta hai to har ek unique value ko, bucket banata hai
har data

* bool $\rightarrow$ boolean query container

Yeh anand - anand conditions blocks ko combine karke ka wrapper hai iske andar har main clause hota hai $\rightarrow$ must, filter, should, aur must-not

must $\rightarrow$ scoring content / relevance content

rule $\rightarrow$ jab block ke andar jo query aati hai documents ko us match ko satisfy करना compulsory hota hai

- jab claus Lucene ka BM25 algo run karta hai

- jab document ko har - score milega hai, jo product uske search term ke sare value close hota, uska -score hark high hoga aur jo list me ~~uske~~ uske upar rank karega

- filter categories or countries
yes / no

- elastic search filter ke result me ek bit set cache (memory 0.2 and 1 ki hitmap) hota hai
hai. jab agla uske category filter
mali hai, to elastic search disk pe search
nahi karta, sirf ram se data run karta
hai.

① <%. %>

eg. ① for if else, loops, valid is

② include files

② <%. = %>

<input type="text" name="fullName" value=

"<%. = it-fullName || "%>" required

③ <%. ~ %> including html of other files

aggregation → in elastic db → similar to count,
group by in mysql

aggregation: {

categories: {terms: {fields: "category", size: 100}}

countries: {terms: {field: "country", size: 100}}

}

unique categories count & name

SELECT category AS key, COUNT(*) AS doc-count

FROM products

GROUP BY category LIMIT 100;

elastic response

{ aggregations: {

categories: {

buckets: [

{ key: 'metal', doc count: 45 },

{

}

① Entry point → server.js

Home → used for creating app instance. const app = new

public folder → the request which start from public are directly served from file system

app object → contain fetch method

↓

used for reading requested url

↓

all the logic of rendering and controlling the application

↓

browser talks with this

It → it → ~~an object whenever data is rendered~~
the data which passed by return
rendering comes in it object

c → context → create new everytime whenever a
new request will come

contains → requested and response data

ETA

<% %>

scriptlet tag

JS logic e.g. if else
nothing prints

<%= %>

interpolation tag
(escaped)

prints value in html
(~~file file included~~)

<%~ %>

raw output tag
(unescaped)

print value
